Modeling in the Stateflow[®] Environment to Support Launch Vehicle Verification Testing for Mission and Fault Management Algorithms in the NASA Space Launch System*

Luis Trevino, Ph.D.

Jacobs ESSSA Group – Marshall Space Flight Center

Mission & Fault Management (M&FM), EV43

Spacecraft and Vehicle Systems Department

04/27/2017

Huntsville, AL

** AIAA Paper previously presented at SPACE 2016, Long Beach CA*

MATLAB Aerospace & Defense Technical Briefing

AIAA Paper Co-Authors

- **Peter Berg**

SLS State Flow Lead, M&FM Team
Stinger Ghaffarian Technologies, Inc.
Intelligent Systems Division
NASA Ames Research Center

- **Dwight England**

Chief, Integrated Systems Health Management &
Automation Branch, EV43
NASA Marshall Space Flight Center

- **Stephen B. Johnson, Ph.D.**

Analysis Lead, M&FM Team
Dependable System Technologies, LLC
Jacobs ESSSA Group
University of Colorado, Colorado Springs

User GUI

The screenshot displays the SAM_execute software interface, which is divided into several functional areas:

- Command:** A text input field containing the command `failure_bus[42]_HIGH_CURRENT=true[42]`. Below it are two buttons labeled 'V' and 'A'.
- Selected Scenario:** A text area displaying the same command: `failure_bus[42]_HIGH_CURRENT=true[42]`.
- Launch Halt:** A large, prominent text box at the bottom left containing the words "LAUNCH HALT".
- M&FM EVENTS:** A log window showing a series of events such as `EVT_[42]_GoFor[42]_CMD_Received`, `EVT_[42]_AUTO_LAUNCH_SEQUENCE`, and `EVT_[42]_Engine_Fail`.
- MISSING NOMINAL EVENTS:** A log window showing events that deviated from the nominal sequence, including `EVT_[42]_Start_Enable_Command_Sent`, `EVT_[42]_Overboard_Bleed_Valve_is_closed`, and `EVT_[42]_CORE_STAGE_FLIGHT`.
- RULE VIOLATIONS:** A log window showing violations of system rules, such as `OPS: Engine [42] Commanded Open without failsafe [42] will not`.
- UNEXPECTED EVENTS:** A log window showing events that were not anticipated, including `EVT_[42]_LOSS_OF_FUNCTION`, `EVT_[42]_Engine_Fail`, and `EVT_[42]_Launch_Halt`.

MATLAB Aerospace & Defense Technical Briefing

VMET, MCaRT, SIL Test Cases for the SAM

Test Case ID	Test Objective	Success Criteria	Duration / Fault Injection
MPS_Heium	Test failure of helium isolation valve	"EVT_ HeliumValve_ Redundancy_Reduced" becomes "True" at Mission_Elapsed_Time = - sec "EVT_ Halt" becomes "True" at Mission_Elapsed_Time = - sec	Test duration is from Mission Elapsed Time = - sec to - sec Fault injected at Mission Elapsed Time = - sec by setting Helium_ Energy = & detected cycles later at - sec and Halt set at Autonomous_Launch_Sequence at - sec

Element	System	Response	Monitored Condition Name	Monitored Condition Description	Start Monitoring	Stop Monitoring	Units	Lower Trigger Limit (TBD)	Upper Trigger Limit (TBD)	Number of Indicators Needed to Generate Response
Booster	Igniter	Safing	Dual Boosters Ignition Failure	Both Boosters fail to ignite after T+ is reached	T+ msec	T+ msec	psia			2 of 2

MATLAB Aerospace & Defense Technical Briefing

Findings: VMET & SAM

MCaRT & SIL

19% of MCaRT entries tested
85.5% passed

45% of SIL test cases executed
27% passed

Finding Types

Logic Interpretation	30%
Editorials	55%
Logic Update	15%
